Attachment to Independent Case Review Report For CDRU # 6437 Case file # 95-255925.

Material Examiner:

Malone (RO)

Remarks:

Case resulted in trial, transcript available.

INDEPENDENT CASE REVIEW REPORT

Comments
(Set forth by above question #, if applicable.
Use "Additional Comments" Sheet, if needed)

File #: 95-256335						
#1: With microscopic hair	comparison, ev	en with the	best note	s, there is no wa	ay to determin	e the comparison
was performed correctly.						
•						
#2: The examination resul	ts set forth in th	e laboratory	report ar	e supported by	the bench not	es, but the
documentation is margina	lly adequate. Th	e notes are	not dated	or initialed and	l are in pencil.	RQ uses
abbreviations to indicate t	he microscopic	characterist	ics of the	hair. These abb	reviations are	difficult to interpret.
There is not documentation	n in the technic	ian's notes t	hat hair v	vas recovered fi	rom the victim	's items (Q1-Q4, Q7-
Q13) or from the suspect'	s items (Q14-Q1	16).				· .
					· · · · · · · · · · · · · · · · · · ·	
Malones' notes indicate th	e hair from the	victim's she	eet (Q12)	matches K3(S)	. K3 is listed i	n the report as

#2 (continued): being the victim's blood sample. K5 is listed in the report as being the suspect's head hair. Malone's notes show K4 as the suspect's pubic hair but the report lists K4 as being the victim's saliva sample.

#3: To testify "within reasonable scientific certainty" that the hair from the victim's sheet is the suspect's hair is not consistent with the laboratory report that says "this hair could have originated" from the suspect.

#5: Malone testifies that is a hair does not have at least 15 characteristics, it is "not unique enough and is of no value for comparison and I will stop the exam here, so there is no real reason to go on". Contrast this testimony to the testimony in 95-255925 (same defendant, different victim).

Malone testifies that it is "highly unlikely" that another person exists who would have hair exactly like the suspect's hair. Microscopic hair comparisons are associative evidence that "do not constitute a basis for positive personal identification", as Malone states in his lab report on this case, and only serve to place an individual into a group of people who could be the possible source of the hair.

Testimony that "from all the literature in the field and my own experience, it is pretty commonly accepted" that the chance of a Type 2 error (an incorrect association-saying the hair came from a person when it did not) "is about one in five thousand". This testimony is incorrect on several counts. The chance of a Type 2 error depends upon the quality of the hair evidence and the training and experience of the hair examiner and is not "pretty commonly accepted" to be 1 in 5000. The 1 in 5000 chance that this evidence hair came from some other person besides the suspect is not supported in the literature. Malone's claim of examining hair from over 10,000 individuals and only being unable to tell the hair apart two times leads him to the 1 in 5000 chance the hair could be from another person besides the suspect. This is not the same as comparing the hair from all those 10,000 people to each other to determine how many would match another.

(The cross-examination part of the testimony is missing)
